# **ABSTRACT** This study was conducted for developing and initially validating a reliable and valid scale for measuring professional standards in teacher education of Pakistan from the perspectives of teacher educators. Data were collected from 300 teacher educators from Punjab, Khyber Pakhtunkhaw and Federal Capital Islamabad. Exploratory factor analysis was used as a technique for initial validation to determine the dimensionality of the scale. Based on literature review a 60 items scale named Professional Standards of Teacher Education Scale (PSTES) was developed based on the national teacher education professional standards set by the government of education in collaboration with USAID for the enhancement of quality of teacher education in the country. The factor analysis identified a \_10-factor scale representing the 10 dimensions of the professional standards of teacher education. The results strongly supported the hypothesized 10 factor scale model of the study. The scale may be used for measuring the beliefs about quality of teacher education professional standards in Pakistan and elsewhere. It is suggested that the scale may be tested in other context for further validation.

#### Introduction

Teacher education has a key role in the development and transformation of any society (Sok & Heng (2024). Quality of teacher education system defines the quality of the manpower produced by the teacher education system (Aajiz et al.,2019). Various scales are available on teacher

education system around the world, however, these scales did not fully cover all the important dimensions or standards of teacher education related to quality of teacher education system in Pakistan. This study aimed to explore perceptions and beliefs of teacher educators about the quality professional standards for teacher education. The findings of the study contribute towards understanding of the standards of quality practices in teacher education.

#### **Literature Review**

The global standards of quality practices in teacher education are changing drastically in view of the demands of the new era. Several new trends have emerged such as technology based instruction, sustainability issues and challenges, policies and plans and new directions in teaching and learning (Fischer, et al, 2022). Due to these and other trends, the status of teacher education is undergoing substantial changes all over the world including Pakistan. The idea of quality standards of teacher education emerged with the realization to enhance the professional role of teachers (Ahmad at al., 2020). Government of Pakistan introduced several changes in the education related to plans and policies of teacher education. One such development was the adoption of the essential professional standards for teacher education which represented and collated with the international standards of quality practices (Ajiz et al. 2019). These standards included subject matter knowledge, human growth and development, Islamic ethical and social values, instructional planning and strategy, assessment, learning environment, effective communication and use of communication technology, collaboration and partnership, continuous professional development, teaching of English as a foreign language (Ahmad & Mirza, 2020; Deeba et al., 2022).

Under this umbrella, efforts were made to introduce national professional standards with STEP program (Strengthening Teacher Education in Pakistan) under the financial help of USAID in 2005. The major aim of this progamme was enhancement of the government efforts for ensuring quality of teacher education in Pakistan and uplifting the policy structures for the ultimate improvement of teacher education standards in the country (Ali, 2011; Ghazi et al. 2013). The STEP program was initiated with the collaboration of various stakeholders to develop professional standards in Pakistan for teachers in order to improve the professional skills of teachers and enable them to deliver positively as professionals. In this regard, the major step was development of the national professional standards for teacher education for the amelioration of teaching and learning standards and accepting the role of teaching as a priority profession for national development. This program was supported by the ministry of education with the assistance of the UNESCO and USAID for the development of teacher education standards in Pakistan (Atta et al.2012; Butt, 2008). Based on this initiative, the professional standards were adopted to equip the teachers to be able to act as creative and active professionals having the required knowledge, skills and attitudes with diversified approaches of teaching and learning and creating learner centered environment in order to meet the standards of 21s century needs (Government of Pakistan, Ministry of Federal Education and Professional Training, 2018).

As part of the global initiatives for quality teacher education, the Pakistani government adopted these collaborative efforts with the hope to have positive impacts on student learning and its teacher education system across the country (Ahmad at al. 2014; Mehmood et al. 2021). The professional standards for quality enhancement in teacher education focused on the importance of transfer of updated knowledge of teaching and learning, assessment and creation of conducive teaching and learning environment as the major goal of these endeavors. The program was centered upon improving the professional skills of the pre-service teaching, master trainers and teacher educators in the field of teaching (Molina et al. 2020). The newly introduced standards

were geared upon the betterment of the professional role of teachers through policies, processes and systems introduced for the certification of the teacher education program (Ahmad et al. 2021; Khan & Haseeb, 2017).

Initially, the quality professional standards were set after consultation with all the stakeholders for the professional development of teachers at primary level, however, they were later on applied to secondary and teacher educators too for fostering the professional knowledge, skills and dispositions of teachers at all levels of education. The standards were aimed to improve the teaching competencies, skills and attributes pf teaching profession all over the country (Liaqat & Afzal, 2019). In order to disseminate the program objectives, workshops, seminars, symposiums and conferences were held all over the country to create awareness among the teachers, teacher educators about the curriculum, teaching and learning aids, documents, handbooks requiring for teaching and learning (Rozi & Khan 2021). To reform teacher education in Pakistan, the STEP initiative was adopted as a parameter for enhancing the quality of teacher education and to prepare teachers for their future roles as competent professionals. The teachers mandated to acquire the quality teaching practices for the preparation of students for their roles as responsible and active citizens rather than just transferring information (Rafiq & Qaiser, 2021).

The teaching professional standards were considered to be the key elements for the reformation of teaching system in the country. These standards were based on essential frameworks, training certification, licensing, qualification indicators and continuous upgradation of professional skills through workshops and professional training certification for teachers. Through the professional standards for quality improvement in teacher education, B.Ed (Hons) and ADE programme were started by the government for increasing accessibility in teacher education and making it more effective in terms of international standards and to do away with the age old previously held traditional practices in teacher education (Akram & Zepeda, 2015; Shaukat & Chaudhury, 2020). For this purpose, intensive training programme (s) were introduced to make teaching a recognized profession meeting the national and international needs of the current century. The efforts were also aimed to change the traditional stereotyped beliefs of teachers about teaching and learning through continuous professional training initiatives (Tariq et al.,2020).

#### **Rationale for the study**

Although, there are numerous measurement tools available in the existing literature for the purpose of assessment of teaching and learning outcomes from the perspective of teachers, students and management, however, in the context of Pakistan, these measures do not fully capture all the major areas of teaching standards (Ali et al., 2022). Secondly, in the available research, the perspectives of teacher educators have not been fully focused regarding the national professional standards (Mehmood et al., 2021). Hence, the existing scales did not comprehensively measure the teaching and learning outcomes of teachers and learners vis a vis the established standards. Most importantly, the existing national quality standards of teacher education were either not considered or touched upon insufficiently. This situation warned the need of such a measurement tool which could fully cover all the recognized national professional standards of teacher education so that a comprehensive tool may be constructed for the complete evaluation of all the 10 standards such as subject knowledge, human growth and development, Islamic ethical and social values, instructional planning and strategy, assessment, learning environment, effective communication and use of communication technology, collaboration and partnership, continuous professional development, teaching of English as a foreign language. To achieve this aim, this study attempted to develop a scale which covers these areas of national professional standards for quality in teacher

#### Journal for Social Sciences Archives, Volume 3, Number 2, 2025

education based on the beliefs of teacher educators. The empirical findings of the study may provide firm theoretical foundation for the development of a reliable and valid scale which may be used for collecting data which can be used for further enhancing the quality standards of teacher education in Pakistan.

#### **Research Objectives**

The present study was designed to meet the following objectives.

- 1. To develop an instrument for measuring teacher educators' beliefs concerning professional standards of teacher education in Pakistan.
- 2. To explore dimensions of the scale using exploratory factor analysis

#### **Scale Development**

The process of scale development consists of the following major steps as mentioned below. The researcher used the five phases of scale development framework of Torchim (2006) for developing the scale. These include, (1) defining the constructs, (2) generating items, (3) expert judgement, (4) item retention and (5) scale administration.

#### **Phase 1: Defining the Construct**

At this stage, the researchers conducted a vast survey of available literature related to the topic. This included researcher papers, documents and other published material. Based on the survey 10 important themes were identified regarding the quality of teacher education in Pakistan. These themes were the 10 national professional standards for teacher education in Pakistan.

#### **Phase 2: Generating Items**

In this stage, the researchers produced items for each professional standards and coactively 60 items were finalized to be tested for further stages.

#### Phase 3: Expert Judgment

At this stage, the researchers consulted three subject experts (PhD in education) for reviewing the items as a requirement of content validation. The experts reviewed the items and based on their feedback, the scale was finalized for further stage.

#### **Phase 4: Item Retention**

At this stage the researchers tested the reliability of the scale and used the item total correlation criterion and communalities to retain or delete the items. The results showed that item correlation and communality values were above the acceptable range.

#### **Phase 5: Scale Administration**

In the last stage, the researchers distributed the newly constructed scale for data collection among the 300 teacher educators. The respondents were selected based on population sample or Census basis.

# **Exploratory Factor Analysis**

The EFA technique was used to find out the sample adequacy for conducting factor analysis based on the collected data. Hence, the factor analysis was conducted to explore the dimensionality of the scale and to determine the factor structure. Varimax rotation was used as a rotation method with principal component analysis along with screeplot (Figure 1) as the extraction method.

#### Results

Table 1: KMO and Bartlett's Test

| Kaiser-Meyer-Olkin Measure of | .942               |           |
|-------------------------------|--------------------|-----------|
|                               | Approx. Chi-Square | 13207.120 |
| Bartlett's Test of Sphericity | df                 | 1770      |
|                               | Sig.               | .000      |

Table 1 shows the values of KMO (.942) and Bartlett's' test of sphericity (.000) provided the sufficient evidence for data adequacy allowing the factor analysis.

Extraction Method: Principal Component Analysis.

Table 3 explains the total variance in the scale based on the PCA method. The total variance of the scale was 67.684. The first dimension (subject knowledge) explained 44.778 % of the variance in the scale. The second dimension (human growth and development) explained 49.920 % of the variance in the scale. The third dimension (Islamic ethical and social values), explained 53.015% of the variance in the scale. The fourth dimension explained (instructional planning and strategy) explained 55.670 % of the variance in the scale. The fifth dimension (assessment) explained 58.146 % of the variance in the scale. The sixth dimension (learning environment) explained 60.429 % of the variance in the scale. The seventh dimension (effective communication and use of communication technology) explained 62.345 % of the variance in the scale. The eight dimension (collaboration and partnership) explained 64.225 % of the variance in the scale. The ninth dimension (continuous professional development) explained 66.009 % of the variance in the scale. The tenth dimension (teaching of English as a foreign language) explained 67.684 % of the variance in the scale.

Rotation Method: Varimax with Kaiser Normalization.

a. Rotation converged in 14 iterations.

Table 4 shows that majority of values of factor loading for each item in the PSTE are above .50 giving a strong evidence for strong correlation among all the variables.

#### **Discussion**

This study aimed to develop an instrument for measuring perspective of teacher educators towards national professional standards set for the quality of teacher education practices in Pakistan. Exploratory factor analysis method was used to identify the factor structure of the 10 factor hypothesized scale. The analysis of the collected data showed that all the values for loading 60

items were within the acceptable range. This study discovered that the first strongest standard was subject knowledge having the highest variance in the overall scale. These findings are in line with previous result findings where subject knowledge has highlight to be the most important factor in the teacher development (Shiddiq et al .,2022). Studies have highlighted that teachers must have updated knowledge about their subject. This will help them to deliver the right knowledge to students. The current study found that human growth and development was the second strongest standard to define quality of teacher education. This finding supports the results of previous studies that the major goal of quality education is promotion of human development and all its faculties in a harmonious way (Zahid & Saleem, 2020).

This finding coincides with previous research findings and even supports the main cardinal feature of all education policies of Pakistan where teachers are mandated to demonstrate high standards of Islamic ethical values inside and outside of the classrooms and guide students accordingly. The fourth strongest standard was instructional planning and strategy. This finding also supports the results of earlier research where teachers are supposed to carry out lesson planning on daily basis before conducting the classroom teaching (Shakir et al. 2021). The fifth strongest standard was assessment that this study explored. This finding too positively supports the importance of assessment in education. The finding is in line with numerous previous research studies which have accepted assessment as being the most important element of teacher education practices (Zheng, 2009). The sixth important standard that this study explored was learning environment. This finding of the current study too supports the results of previous research.

According to teacher education scholars the most important element of successful instruction is planning and implementing a truly interactive and supportive learning environment. Studies have reported a strong positive correlation between learning environment and students' learning outcomes (Qureshi & Kalsoom, 2022). The seventh most important standard was discovered to be effective communication and use of communication technology. This finding strong relates to the results of previous studies where use of technology has been declared to be an essential part of effective teaching and learning. All national education policies have made use of instructional and communication technology as the foundation of modern teaching education and hence the use of multiple technology tools has been declared to be compulsory at all levels of education (Alshurfat, 2016; Munawar et al. 2020).

This study found that the eight most essential standard was collaboration and partnership. This also strongly supports the findings of earlier research that schools are community centers and teacher must connect to parents and community. Hence, this practice has also been implemented in the education system where parent teacher councils have been formed to promote strong relationship between parents and schools and parents and teachers. This current research found that the ninth strongest standard was continuous professional development. This finding also supports many findings of previous research studies which have documented the importance of teacher training and continuous professional development as important factor of quality education (Altaf & Saeed, 2019). Studies have reported that teacher need to be provided training on latest and updated tools of instruction and their teaching skills must be improved (Aslam, et al. 2021). Last but not the least. The tenth important and strongest standard was teaching of English as a foreign language. Previous studies have also highlighted the importance of English as international lingua franca.

Being the official language of Pakistan, its importance in teacher education is manifold. It has been documented in all the national educational policies that English will be used as a medium of instruction at all levels of education (Angaiz et al. 2021).

#### **Conclusion**

This study aimed to develop a scale to measure teacher educators' beliefs regarding the quality of teacher education standards in Pakistan. The study concluded that PSTES was a reliable and valid scale which can be used by teachers and other practitioners to measure the professional standards of teacher education. The scale meets all the parameters and requirements for initial validation of an instrument based on psychometric rules. The study provided strong support for the factor loadings for all variables of the scale which were within the acceptable range. The strong mean score of each item with the good commonality values also provided strong support for the validity of the scale. It is suggested that the scale may be used to measure perspectives of teacher educators and other stakeholders for the improvement of teacher education system.

### **Limitations and Future Direction**

The current study was conducted in the area of teacher education in Pakistani context with a small number of sample. However, it is further suggested that future studies may be conducted in other fields and area for further validation of the scale and its refinement.
